

# CHRISTENSEN'S PLANT CENTER

## Wholesale Supplier To Landscape Professionals

Restoration starts with a thorough cleaning. The amount of debris cannot be processed by the aeration and filtration system, and unfortunately, there is no potion that will magically dissolve the deposits.

First, pump stagnant water out of pond. Take care to preserve any wanted aquatic life forms. Removal of the water will make it easier to scoop out the accumulated pond poo. While the pond is devoid of water, inspect the liner and plumbing for damage and make any necessary repairs.

Rinse the lining and pump out the water again.

Clean the filters and install the pump.

Refill the pond with clean water and start the pump.

Finally, pond additives such as bacteria, pH buffer, clarifiers, algaecide, etc. should be added to ensure balance and complete ecosystem restoration.

You have reached the finish, found a way to flow with the rotation of a round-about. I salute you with a secret fraternal hand shake, aloha.
